

BATHROOM

Care & Maintenance Guide

Keep your bathroom looking its best.

Regular care will help preserve the appearance and performance of your tiles, cabinetry, tapware, glass, mirrors and bathroom fixtures. A simple maintenance routine is usually all that is required.

01

INTRODUCTION

Keep Your Bathroom Looking Its Best

Your bathroom is exposed to water, humidity, cleaning products and everyday use.

Regular care will help preserve the appearance and performance of your tiles, cabinetry, tapware, glass, mirrors and bathroom fixtures.

A simple maintenance routine is usually all that is required.

GENERAL CARE

We recommend:

- Wiping down wet surfaces after use where practical
- Keeping the bathroom well ventilated
- Cleaning regularly to prevent soap, mineral and grime build-up
- Using mild, non-abrasive cleaning products
- Attending to damaged sealants or grout when noticed
- Avoiding excessive moisture around cabinetry
- Following any product-specific manufacturer instructions provided with your bathroom products

AVOID HARSH CLEANERS

Unless specifically approved for the product, avoid:

- Abrasive powders or creams
- Scouring pads and steel wool
- Strong acids or alkaline cleaners
- Bleach-based products on sensitive finishes
- Solvent cleaners
- Paint thinners or acetone
- Aggressive mould-removal chemicals on tapware and cabinetry

Always test unfamiliar cleaning products on a small, inconspicuous area first.

02 TILES & GROUT

Routine Cleaning

Clean tiled surfaces regularly using warm water and a mild, pH-neutral cleaner.

Use a soft cloth, mop or non-abrasive sponge.

Avoid allowing soap residue, body oils and mineral deposits to build up over extended periods.

GROUT

Grout should be cleaned regularly using a suitable non-abrasive cleaner.

Avoid excessive scrubbing with hard brushes, which can gradually wear or damage grout joints.

Discolouration of grout does not necessarily indicate failure and may occur naturally from moisture, soaps and everyday use.

SILICONE & SEALANTS

Silicone joints should be periodically inspected around:

- Shower screens
- Basins
- Baths
- Wall and floor junctions
- Vanities
- Penetrations

Look for cracking, separation, mould growth or deterioration.

Sealants are maintenance items and may require replacement during the life of the bathroom.

If a sealant joint has failed, arrange for it to be repaired rather than allowing water to continue entering the surrounding area.

03 SHOWER AREAS

Reduce Moisture Build-Up

After showering:

- Use the exhaust fan
- Remove excessive standing water where practical
- Allow the room to ventilate
- Leave the shower area open to dry

Good ventilation reduces condensation, mould growth and long-term moisture exposure.

SHOWER DRAINAGE

Keep floor wastes and shower drains clear of:

- Hair
- Soap residue
- Dirt
- Other debris

Slow drainage should be investigated early.

Do not use highly aggressive drain-cleaning chemicals unless confirmed suitable for the plumbing and bathroom finishes.

04 TAPWARE & METAL FINISHES

Protect the Finish

Tapware should be cleaned using warm water, mild soap and a soft cloth.

After cleaning, rinse with clean water and dry with a soft cloth.

This is particularly important for decorative finishes such as:

- Brushed nickel
- Brushed brass
- Gunmetal
- Matte black
- Chrome
- Coloured finishes

Avoid abrasive cleaners and harsh chemicals.

Do not leave cleaning products sitting on tapware for prolonged periods.

Some bathroom cleaners designed for tiles or toilets can damage plated or coated metal finishes.

MINERAL BUILD-UP

In areas with mineral-heavy water, deposits may develop around outlets and aerators.

Clean these regularly using the maintenance method recommended for the particular finish.

Do not scrape deposits away using metal tools.

05 VANITIES & CABINETRY

Keep Cabinetry Dry

Bathroom cabinetry is designed for use in wet environments, but it should not be exposed to excessive or prolonged water.

Wipe up spills promptly, particularly around:

- Basin edges
- Cabinet doors
- Drawer fronts
- Benchtop joins
- Tap penetrations
- Cabinet bases

Avoid allowing water to pool on cabinetry or benchtops.

CLEANING

Use a soft damp cloth with mild detergent.

Dry the surface after cleaning.

Avoid:

- Saturating cabinetry
- Steam cleaning
- Abrasive pads
- Strong chemicals
- Allowing wet towels to rest against cabinetry for extended periods

If hinges or drawers require adjustment over time, they should be adjusted rather than forced.

06 SHOWER GLASS & MIRRORS

Shower Glass

Regular cleaning helps prevent soap and mineral deposits from becoming difficult to remove.

Use:

- Clean water
- Mild glass cleaner
- Soft cloths
- A non-abrasive squeegee

Using a squeegee after showering can significantly reduce water marks and build-up.

Avoid metal scrapers and abrasive pads.

MIRRORS

Clean mirrors using a suitable glass cleaner applied to a cloth rather than spraying large quantities directly around the edges.

Avoid allowing excessive moisture or cleaning products to remain around mirror edges or backing.

07 FIXTURES

Toilets, Basins & Bathroom Fixtures

Ceramic and similar bathroom fixtures should be cleaned regularly using mild, non-abrasive products.

Avoid striking fixtures with hard objects.

Do not use abrasive cleaning tools that may scratch glazed surfaces.

Toilet seats, flush plates and other finished components may require different cleaning methods to the ceramic toilet itself.

Where decorative metal finishes are present, treat them in the same manner as tapware.

08 ONGOING MAINTENANCE

Quick Maintenance Check

WEEKLY

- Clean tapware and fixtures
- Clean basin and vanity surfaces
- Clean shower glass
- Remove standing water and soap residue
- Keep floor wastes clear

EVERY FEW MONTHS

- Check silicone and sealant joints
- Inspect grout condition
- Check cabinetry for moisture damage
- Check tapware for leaks
- Inspect shower-screen hardware
- Check toilets and basins for movement or leaks
- Clean exhaust fans and ventilation grilles where accessible

ADDRESS EARLY

Arrange further inspection if you notice:

- Persistent water leaks
- Swollen or damaged cabinetry
- Cracked tiles
- Loose fixtures
- Failed silicone
- Significant grout deterioration
- Water escaping outside the shower area
- Unusual movement in a vanity, basin or toilet
- Persistent mould or moisture that does not improve with normal cleaning and ventilation

09

CARE FOR YOUR BATHROOM

Designed to Be Enjoyed. Maintained to Last.

Regular cleaning, good ventilation and early attention to maintenance issues will help preserve your bathroom for years to come.

The most important principles are simple:

Keep it clean. Keep it ventilated. Keep water where it belongs.

Where manufacturer-specific care instructions are provided for a particular product, finish or material, those instructions should be followed in conjunction with this guide.

NEED ASSISTANCE?

If you are unsure about the care or maintenance of a product supplied as part of your Atelier bathroom package, contact our team with your project details and photographs of the relevant item.
